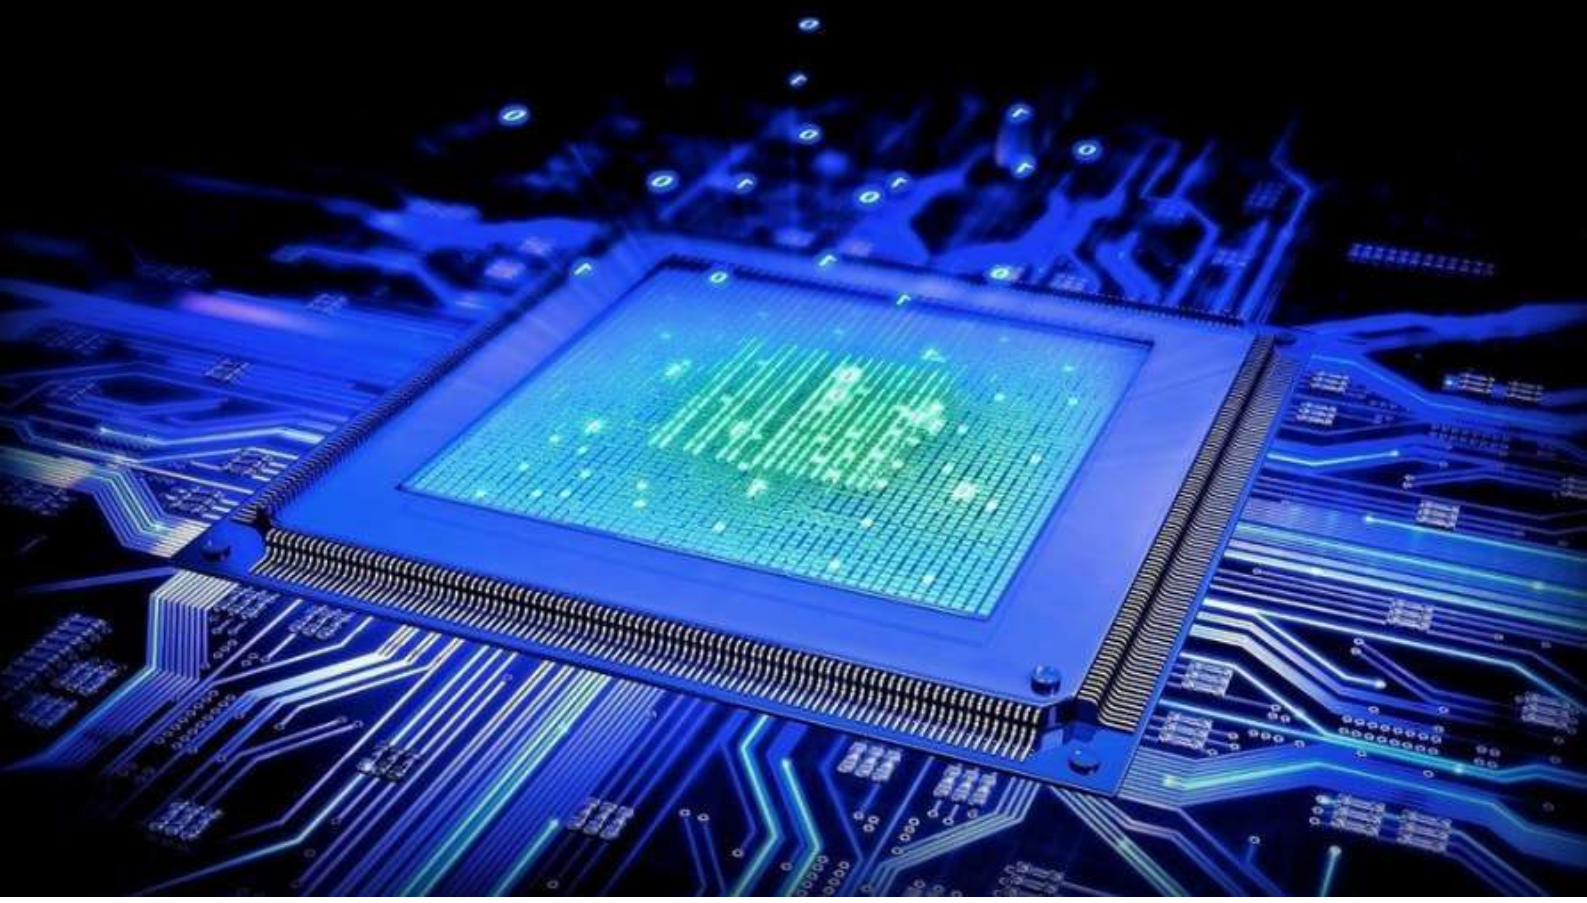
DIGITAL ELECTRONICS



Digital Electronics

DEVARAKONDA SURESH JAHNAVI

→ Signal: A func, that represents the variation of a physical quantity with respect to any parameter

(or)

Signal is variation of electrical quantity (V (or) I) with time.

Analog signal: can define any value within interval

Discrete time signal: can define for discrete time interval (subset of analog signal).

Digital signal:- Here, we represent both time & magnitude. We divide the magnitude axis in to fixed number of levels and "the signals can take value equal to these values/levels only".

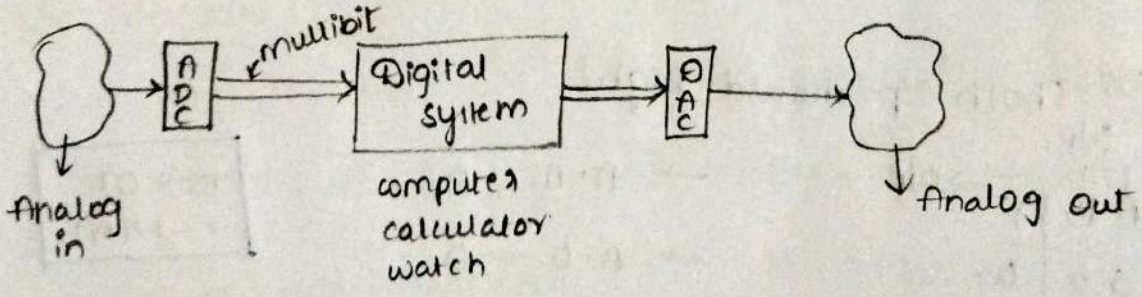
Need of Digital signal:-

→ All real life signals are analog

→ Digital signal is used in communication process to minimize the effect of noise (unwanted signal).

→ Digital signal is good when noise is small

Introduction of digital signal:-



Digital system

↓

Sub system

↓

Module

↓

Basic unit (logic gates)

↓

Circuits (transistors, resistors, capacitors)

Advantages of digital signal over analog:-

→ Noise immunity
→ Low B.W usage
→ Encryption
→ Efficiency is high for long distance transmission

0Volt → "0" → "OFF"
5Volt → "1" → "ON"

342 vs 101
↓ ↓
3-digit number 3-bit number

→ 8 bit = 1byte

n = no.of levels
m = no.of switchs = no.of bits
$n = 2^m$

Eg: 0-5 (1 switchs)
0V, 5V

0-5 (2 switchs)
0V, 1.25V, 2.5V, 3.75V

m↑, accuracy ↑.

Introduction to Boolean Algebra:-

→ It is the set of rules used to simplify the given logic expression "without changing its functionality".

→ It is used when no.of variables are less.

Rules:

i) Complement: (NOT) A complement = $\bar{A}$ or A' or (not A) [$\bar{0}=1$, $\bar{1}=0$]

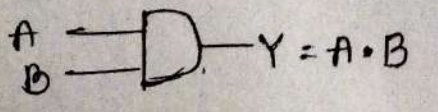
* $\overline{(\bar{A})} = A$

(ii) AND: (both i/p should high)

i/p A	i/p B	o/p Y
0	0	0
0	1	0
1	0	0
1	1	1

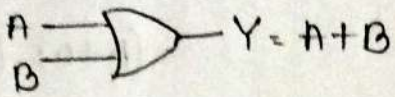
→ $A \cdot A = A$
→ $A \cdot 0 = 0$
→ $A \cdot 1 = A$
→ $A \cdot \bar{A} = 0$

+ → OR
· → AND



iii) OR: (either one i/p should be high)

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	1



→ $Y = A+A = A$

→ $A+0 = A$

→ $\boxed{A+1 = 1}$

→ $A+\bar{A} = 1$

iv) Distributive law:-

→ $A\cdot(B+C) = A\cdot B + A\cdot C$

→ $A+(B\cdot C) = (A+B)\cdot(A+C)$

* → $\boxed{A+\bar{A}B = A+B}$

$A+(\bar{A}\cdot B) = (A+\bar{A})\cdot(A+B)$

$= 1\cdot(A+B)$

$= A+B$

* → $\boxed{\bar{A}+AB = \bar{A}+B}$

$(\bar{A}+A)\cdot(\bar{A}+B)$

$= 1\cdot(\bar{A}+B)$

(v) Commutative law:-

→ $A+B = B+A$

→ $A\cdot B = B\cdot A$

(vi) Associative law:-

→ $(A\cdot B)\cdot C = A\cdot(B\cdot C)$

Priority:- NOT, AND, OR

* vii) De Morgan law:

V.I

→ $\overline{(A+B)} = \bar{A}\cdot\bar{B}$

→ $\overline{(A\cdot B)} = \bar{A}+\bar{B}$

Eg: 1) $Y = BA\bar{C} + \bar{B}A\bar{C} + B\bar{C}$

$= A\bar{C}[B+\bar{B}] + B\bar{C}$

$= A\bar{C}\cdot 1 + B\bar{C}$

$= A\bar{C} + B\bar{C}$

$Y = \bar{C}[A+B]$

2) $Y = AB + AB' \Rightarrow A[B+B'] = A$

3) $Y = AB + A\bar{B}C + A\bar{B}\bar{C}$

$= A[B+\bar{B}C+\bar{B}\bar{C}]$

$= A[B+\bar{B}[C+\bar{C}]]$

$= A[B+\bar{B}]$

$= A$

Advantages of minimization:

→ Reduction of hardware (↓ gates)

→ Cost ↓, speed ↑, area ↓

Eg's: 4) $Y = (A+B+C)(A+\bar{B}+C)(A+B+\bar{C})$

$= (A+B+C\cdot\bar{C})\cdot(A+\bar{B}+C)$

$= (A+B+0)\cdot(A+\bar{B}+C)$

$= (A+B)\cdot(A+\bar{B}+C)$

$= A+(B)\cdot(B\bar{B}+C))$

$= A+B\cdot(\bar{B}+C)$

$= A+BC$

$Y = A+BC$

5) $Y = (A+B)(A+\bar{B})(\bar{A}+B)(\bar{A}+\bar{B})$

$= (A(\bar{B}\cdot B))\cdot(\bar{A}+(B\cdot\bar{B}))$

$= (A+0)\cdot(\bar{A}+0)$

$= A\cdot\bar{A}$

$Y = 0$

6) $Y = A\cdot B+\bar{A}\cdot C+B\cdot C$

$= B\cdot(A+C)+\bar{A}C$

$= A\cdot B+\bar{A}\cdot C+(A+\bar{A})BC$

$= AB+\bar{A}\cdot C+ABC+\bar{A}BC$

$= AB(1+C)+\bar{A}C(1+B)$

$= AB\cdot 1+\bar{A}C\cdot 1$

$Y = AB+\bar{A}C$

Redundancy theorem:-

→ three variables

→ Each variable is repeated twice

→ one variable is complemented

→ Take the complemented variable means don't redundant that variable terms.

$Y = A\cdot B+\bar{A}\cdot C+B\cdot C$ → redundant term

$= A\cdot B+A'C$

7) $F = AB+B\bar{C}+AC$

redundant

$F = B\bar{C}+AC$

8) $f = A\bar{B}+BC+A\bar{C}$ → redundant

$f = A\bar{B}+BC$

9) $F = (A+B)\cdot(\bar{A}+C)\cdot(B+C)$ → redundant

$F = (A+B)\cdot(\bar{A}+C)$

10) $G = (A+B)(\bar{B}+C)(A+C)$

redundant

$G = (A+B)(\bar{B}+C)$

10) $F = \bar{A}\bar{B}+A\bar{C}+B\bar{C}$ → ?

if all variables are complemented then take non-complemented term.

$F = \bar{A}\bar{B}+A\bar{C}$

Sum of product (sop form): (used when the o/p is "1")

	A	B	C	F
m_0	0	0	0	0
m_1	0	0	1	0
m_2	0	1	0	1
m_3	0	1	1	0
m_4	1	0	0	1
m_5	1	0	1	1
m_6	1	1	0	1
m_7	1	1	1	1

Total no. of combinations $= 2^n$

n = no. of variables

$= 2^3$

$= 8$

$\bar{x} = 0$

$x = 1$

(sop form) $F = \bar{A}\cdot B\cdot\bar{C}\ (m_2) + A\cdot\bar{B}\cdot\bar{C}\ (m_4) + A\bar{B}\cdot C\ (m_5) + A\cdot B\bar{C}\ (m_6) + AB\cdot C\ (m_7)$

standard (or) canonical sop form (because we directly written from truth table).

Minterms → SOP

$F(A,B,C) = m_2 + m_4 + m_5 + m_6 + m_7$

$= \Sigma m(2,4,5,6,7)$

$F = \bar{A}B\bar{C} + A\bar{B}C + A\bar{B}C + AB\bar{C} + ABC$

$= \bar{A}B\bar{C} + A\bar{B}[\bar{C}+C] + AB[\bar{C}+C]$

$= \bar{A}B\bar{C} + A\bar{B} + AB \Rightarrow \bar{A}B\bar{C} + A[\bar{B}+B]$

$= \bar{A}B\bar{C} + A$

$F = A + B\bar{C}$ ← minimal SOP form

reduce: $A + \bar{A}B$, $A + B$

↳ Each minterm does not have all the variables in normal or complemented form. but in canonical/standard sop form each minterm is having all the variables in normal or complemented form. [eg: $F = \bar{A}B + AB + \bar{A}\bar{B}$ → here we have $A, B, \bar{A}, \bar{B}$]

$N_1 \rightarrow N_2$

N_1 ↙ total no. of digits

$\boxed{r_1 < r_2 \quad N_1 > N_2}$

eg:

$(7392)_{10} \rightarrow (1110011100000)_2$

$(7392)_{10} \rightarrow (16340)_8$

$(7392)_{10} \rightarrow (1CE0)_{16}$

Binary No. system:-

Base/radix = 2 → {0, 1}

Binary digits (0, 1) are called as "bits".

eg: 1 0 1 0 1 (2^4 2^3 2^2 2^1 2^0)

$\rightarrow 1 \times 2^4 + 0 \times 2^3 + 1 \times 2^3 + 0 \times 2^1 + 1 \times 2^0$

$= 1 \times 16 + 0 \times 8 + 1 \times 4 + 0 \times 2 + 1 \times 1$

$= 16 + 0 + 4 + 0 + 1$

$= 21$

r's complement:- < r's complement (radix complement)
r-1's complement (diminished radix complement)

↳ used to simply subtraction operations.

ex:- comp of $(7)_{10}$

Ans:- 3

* Formula : $r^n - N$ → r's complement

r = radix

N = given no.

n = total no. of digits

1) N = 5690

Determine 10's complement

sol:- r = 10, N = 5690

n = 4

$10^4 - 5690 = 4310$

2) N = 1101

determine 2's comp

sol:- r = 2, N = 1101

n = 4

$= (2^4)_{10} - 1101$

$= 10000 - 1101$

$= 00011$

```
 10000
- 1101
 00011
```

3) N = 76895

10's comp

sol:- $10^5 - 76895$

$= 100000 - 76895$

$= 23105$

4) N = 11011

2's comp

sol:- $= 2^5 - 11011$

$= (32)_{10} - 11011$

$= (100000) - 11011$

```
 100000

→ (r-1)'s complement:

r's comp	(r-1)'s comp
r = 10	10's comp → 9's comp
r = 2	2's comp → 1's comp
r = 8	8's comp → 7's comp
r = 16	16's comp → f's comp

r's complement = $r^n - N$

(r-1)'s complement = $r^n - N - 1$

(r-1)'s comp = r's comp − 1

eg:- 7's comp of 5674 (octal no)

$= 84 - 5674 - 1$

$= (4096)_{10} - 5674 - 1$

$= (10000)_8 - 5674 - 1$

$= 7777 - 5674$ ✓

$= 2103$

eg 2's comp of 1101

ex 1's comp 0010

2's comp 0011

(r-1)'s comp + 1 = r's comp → borrow involved

↓

NO borrow operation is involved

eg 8's comp of 5674

sol 7's comp of 5674 + 1

2103 + 1 = 2104

1's & 2's complement:

Eg 1) 1's complement of $(1010)_2$ is 0101 → 1111 − 1010 = 0101

2) 2's complement of $(10111010)_2$ is 01000110

1's - 01000101

2's - 01000101 + 1 = 01000110

3) 2's comp of 1100111 is 0011001

0011000 + 1 = 0011001

Shortcut for 2's comp:

Step 1: write down the given number

Step 2: Starting from LSB, copy all the zeros till the first 1.

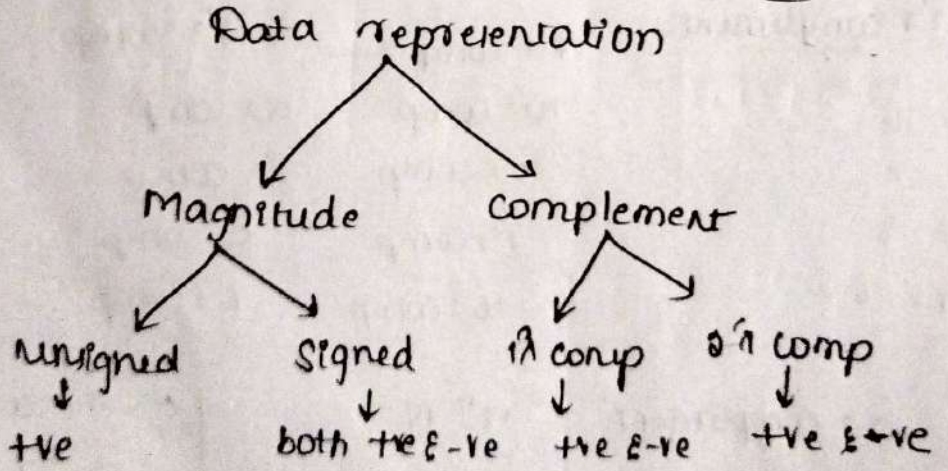
Step 3: Copy the first 1.

Step 4: Complement all the remaining bit.

Eg: 1) 10111000 → 01001000 (2's comp)

2) 101100 → 010100 (2's comp)

Data representation using Signed Magnitude:



→ In all 4 representation +ve no. is represented in same way.

(i) Unsigned Magnitude:-

+6 = 110

-6 = can't represent

(ii) Signed Magnitude:-

(i) +6 = 0110, -6 = 1110 } n=4 → Sign bit + Mag. (+ → 0, − → 1) + Mag

(ii) +13 = 01101, -13 = 11101 } n=5, -15 to +15

range:- * $-(2^{n-1}-1)$ to $+(2^{n-1}-1)$

n → no. of variable/bits

If n=4 → -7 to +7

(iii) +9 = 01100

-9 = 11100

(iv) +16 = 010000, -16 = 110000 } n=6, -31 to +31

(iii) 1's complement:

Eg (i) +6 = 0110, -6 = 1001 } 1's comp

(ii) +9 = 01001, -9 = 10110 } 1's comp

+0 = 0000

-0 = 1111 } to overcome this we have 2's comp

range:

* $-(2^{n-1}-1)$ to $(2^{n-1}-1)$

n=4 → -7 to +7 (4 bit range)

n=5 -15 to +15

n=6 -32 to 32

(iii) +10 = 01010

-10 = 10101

v) +4 = 0100

-4 = 1011

iv) +23 = 010111

-23 = 101000

because +23 is range of -32 to +32 ie n=6 (bits)

1's comp of any no. is -ve of that no.

---

v) +9 = 1001

-9 = 10111

(-9 with 2's comp for +9, we get 0111, but this can't be represented as -9 being signed rep, we will have to use 5 bits, hence -9 = 10111).

(iv) 2's complement:

(i) +6 = 0110, -6 = 1010 } 2's complement

(ii) +4 = 0100, -4 = 1100 } 2's comp

only one zero : 0000

Range:

$-(2^{n-1})$ to $(2^{n-1}-1)$

n=4

-2^3 to 2^3-1

-8 to +7

(iii) +5 = 0101

-5 = 1011

1 → -ve

(iv) -8 = 1000 (remember 4 bit representation has range from -8)

+8 = 01000 (4-bit rep has range from -8 to +7, so we need 5 bits)

Binary subtraction using 1's complement:

S1: Convert numbers to be subtracted to its 1's complement form

S2: Perform the addition.

$A - B = A + (-B)$

↑ 1's comp of $B = -B$

*S3: (i) If the final carry is '1', then add it to the result obtained in step 2. (end around carry)

(ii) If the final carry is '0', then result obtained in step 2 is negative & in the 1's comp form

Eg: 1) 1100 − 0101

A = 1100

S1) B = 0101

1's comp of B = 1010

S2) A + (−B) = 1100 + 1010

1's comp of B ⇒ 1100
1010
0110

final carry = 1

So add to result

S3)
0110
+ 1
0111

2) (0101) − (1100)

A = 0101

S1) B = 1100

1's comp of B = 0011

S2) A + (−B) =
0 0 1
0101
0011
1000

final carry = 0

S3) Result obtained = 1000

is −ve, 1's complement it

0111 ✓

Binary sub using 2's complement:

S1: Convert no. to be subtracted to its 2's comp form

S2: perform addition

S3: (i) FC is 1, then result is +ve & its true form

(ii) FC is 0, then result is −ve & its in 2's comp form

Note: Neglect FC in 2's comp (like don't write FC in ans)

Eg: ① (1001) − (0100)
A B

S1) 2's comp B is = 1011 + 1
= 1100

S2)
1001
+1100
1 0101

FC neglect

+ve ✓

Overflow

n = 4

range: −8 to 8, if we take FC = 1 then 10101 = 21 not in range

* Condition for overflow :-

x & y are the sign bit of, a no.

z is the sign bit of result

$\bar{x} \cdot \bar{y} \cdot z + x \cdot y \cdot \bar{z}$ = 0 (No overflow)

= 1 (overflow)

Eg ① $(0110)_2 - (1011)_2$

A = 0110

B = 1011

(1) 2's comp = 0100 + 1 = 0101
of B

(2) 0110
(+) 0101
1011 (-5)

no F.C, result is -ve in
2's comp form

(3) 10 1011
1's comp of result = 0100
2's comp of result = 0101 (+5)

What is parity:-

→ It is concept to detect errors
→ A "single bit error" is "detected" by it.
→ If there is error in 2 or more bits then it donot going to detect error.

→ 
we send a bit n-bit stream & also an extra bit (tells total 1's)

Eg 0100 → odd no of 1
0101 → even no of 1

two types of parity < Even / Odd.

* Even parity

original signal + parity bit
0100 + 1
1100 + 0
↗ even no of 1's unnai kabbati parity bit = 0

0100 + 1 = 0101
original signal +1 = 0101 → receiver detect (but received odd, so there is an error)

we sent even parity (transmitted)

* odd parity

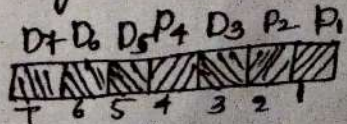
original signal + parity bit
0100 + 0
1100 + 1
↗ even no of 1's unnai kabbati parity bit = 1

Hamming code:-

→ easy to implement
→ 7-bit hamming code is used commonly.

Data bits - 4 } 7-bit hamming code
parity bits - 3

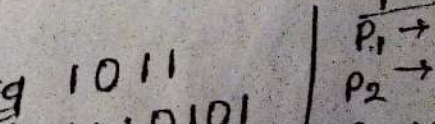
→ 2^n { where n=0,1, ... n }



for where parity bits should lie.

$2^0 = 1$
$2^1 = 2$

Eg 1011
↳ 1010101



even 0 1 0
$P_1 \rightarrow D_3 D_5 D_7$
$P_2 \rightarrow D_3 D_6 D_7$
$P_4 \rightarrow D_5 D_6 D_7$

$P_2 = D_3 D_6 D_7$
$= 1\ 0\ 1$
$P_2 = 0$

$P_1 = D_3 D_5 D_7$
$= 1\ 1\ 1$

$P_4 = D_5 D_6 D_7$
$= 1\ 0\ 1$
$P_4 = 0$ for even parity → $P_1 = 1$

eg: If the 7-bit hamming code word received by a receiver is 1011011. Assuming the even parity. (Imp) State whether the received code word is crt or wrong. If wrong locate the bit having error.

D_7	D_6	D_5	P_4	D_3	P_2	P_1
1	0	1	1	0	1	1

Sol: 1 0 1 1 0 1 1

D_5 D_6 D_7 P_4

1 1 0 1 → total no. of 1's P_4 3 odd

$P_4 = 1$

for even parity 10 wrong, odd parity error.

$P_1 = D_3 D_5 D_7$ ✗

$P_2 = D_3 D_6 D_7$ ✗

$P_4 = D_5 D_6 D_7$ ✗

~~$P_4 = 0$~~ ↳ *If we get odd parity, but mentioned even parity then just Parity bit = 1

Why we get ep, but min op, Parity bit = 1

P_2 D_3 D_6 D_7 2 no. of 1's

1 0 0 1 → even parity

$P_2 = 0$ no error

P_1 D_3 D_5 D_7

1 0 1 1 → 3 1's odd parity

$P_1 = 1$

P_4 P_2 P_1

$(1\ 0\ 1)_2 = (5)_{10}$

So crt code = 1001011

Logic gates

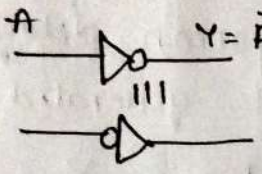
Logic gates: It is a physical device which performs logic operation on one or more logical inputs, & produces a single logical output. [Inversion, logical multiplication, logical sum etc...]

(i) Basic gates : NOT, AND, OR [Because we can implement any logic by using these gates]

(ii) Universal gates : NAND, NOR [Because, by using only NAND or only NOR we can implement and digital system]

(iii) Arithmetic gates : X-OR, X-NOR [Because, we use them in arithmetic gate]

NOT Gate:-



Truth table:

↳ table having o/p from all possible combinations of i/p's

A	Y
0	1
1	0

a) 
→ 1 if i/p = 1
0 if i/p = 0

gate

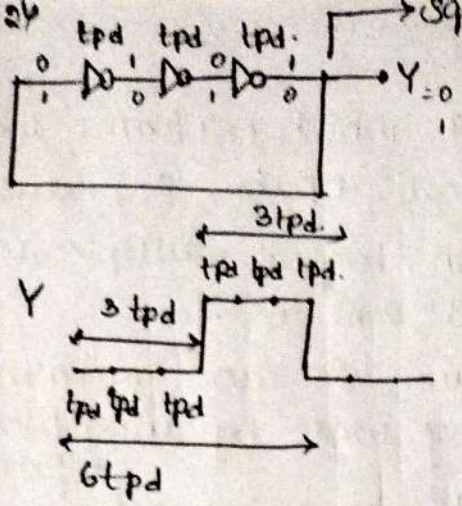
~~a)~~ Buffer [i/p = o/p] → 
because of feedback it is not buffer

b) Astable MV → [Astable, in which the ckt is not stable in either state, it continuously switches from one state to other]

c) Bistable MV

d) Sq wave gen → [Bistable, in which the ckt is stable in either state, It can be flipped from one state to the other by an external trigger pulse.]

06-24



Sq. wave generator / Astable MV / Clk gen / ring oscillator

tpd = propagation delay

[to get o/p we need some time that delay is called as propagation delay]

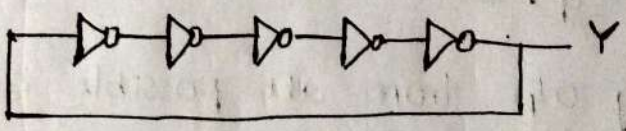
time period = the time that signal / function repeats the same

$= 6t_{pd}$

$$\boxed{T = 2nt_{pd}}$$

n: no. of NOT gates

3) In the ckt shown, the propagation delay of each NOT gate is 100 psec. Then freq of generated square wave is



$T = 2 \times 5 \times 100 \times 10^{-12}$ (psec)

$T = 1000 \times 10^{-12}$

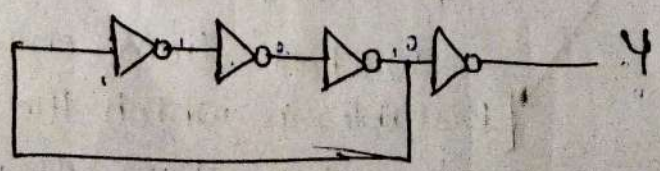
$T = 10^{-9}$

$f = \frac{1}{T}$

$f = \frac{1}{10^{-9}}$

$f = 10^{9} \Rightarrow f = 1\,GHz$.

4) In the circuit shown, the propagation delay of each NOT gate is 8nsec, then the time period of generated square wave is



$T = 2 \times 3 \times 2$ nsec

$T = 12$ nsec ✱ . {only considered within FB}

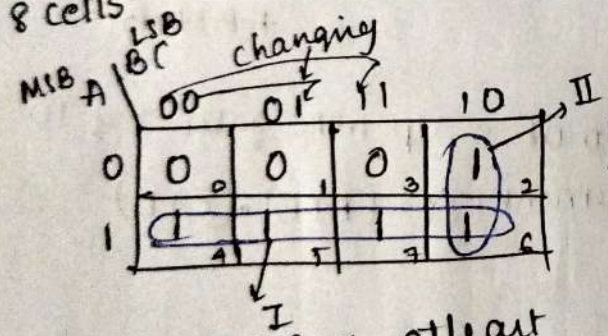
$= A + \bar{A}B\bar{C}$

$= A + B\bar{C}$

8 cells



While pairing atleast one new cell must be there

Pairing rule

2 '1's
4 '1's
8 '1's
16 '1's

priority order high to low
16 → 8 → 4 → 2

* Diagonal pairing X

$F = I + II$ (implicants)

F = non changing variables

$F = A \cdot 1 \cdot 1 + 1 \cdot B\bar{C}$

A changing

B1 is changing

$B\bar{C}$ not changing (10)

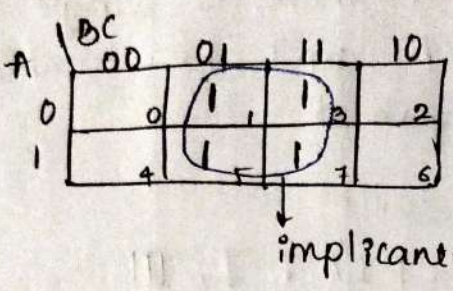
eg 1: $f(A,B,C) = \Sigma m(1,3,5,7)$ (M1, M3, M5, M7)

MSB — LSB — SOP

(i) Find out no. of variables = $n = 3$ (A, B, C)

(ii) No. of cells in K-map = $2^n = 2^3 = 8$

Sol

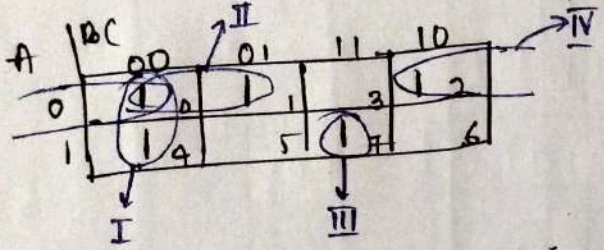


implicant - I

$f = C$ ✓

eg 2: $f(A,B,C) = \Sigma m(0,1,2,4,7)$

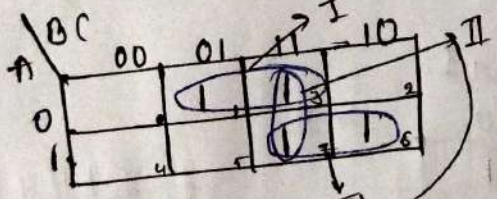
Sol: $n = 3$, 8 cells



$F = I + II + III + IV$

$f = \bar{B}\bar{C} + \bar{A}\bar{B} + \bar{A}\bar{C} +$ ABC ✓ Any

eg 3 $F(A,B,C) = \Sigma m(1,3,6,7)$



$f = I + II + III$

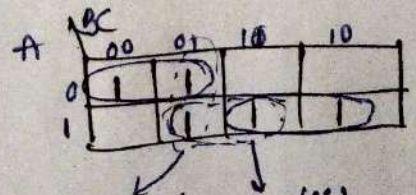
$= \bar{A}C + AB + \cancel{BC}$ ↓ redundant

redundant because no new cell while pairing.

Redundancy theorm

- 3 variable
- each variable repeated twice
- 1 variable is complemented

eg: $F(A,B,C) = \Sigma m(0,1,5,6,7)$



Case i: $f = A\bar{B} + \bar{A}\bar{B} + AC$

Case ii: $f = A\bar{B} + \bar{A}\bar{B} + \bar{B}C$

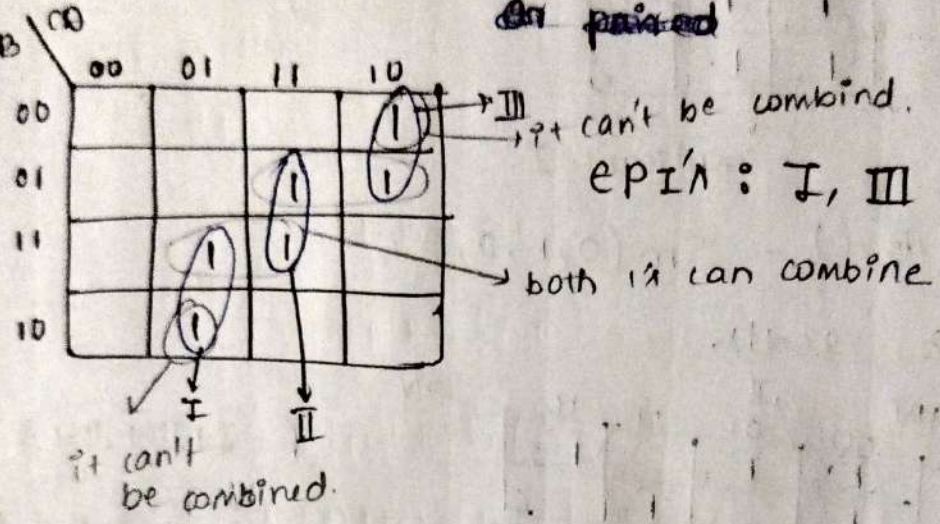
Fine result is min but not same values

Implicants:- The group of 1's is called as implicants
eg: 1, 2, 4, 8, 16 - - - etc.

Prime Implicants:- It is the largest possible group of 1's in K-map

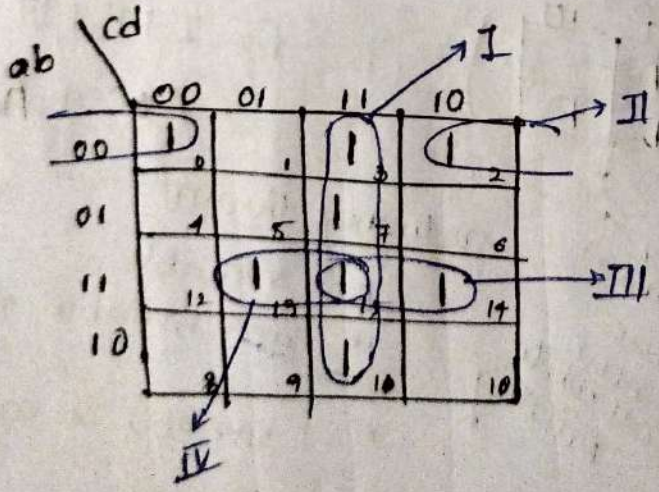
Essential prime implicants:- Atleast there is single one which can't be combined
(EPI) ~~or paired~~

eg :-



Eg: 4-Map with 4 variables :

$f(a,b,c,d) = \Sigma m(0,2,3,7,11,13,14,15)$

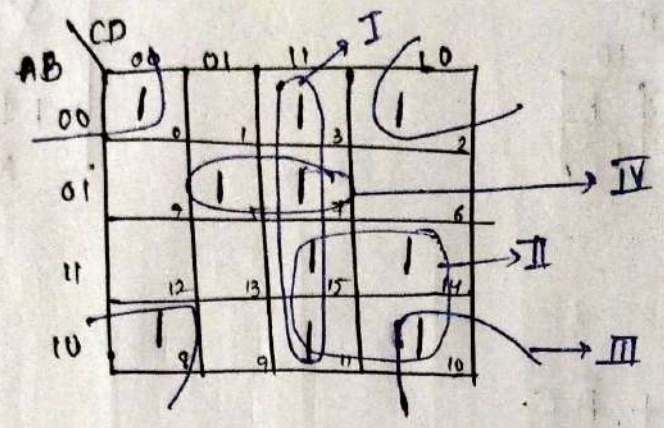


$f = I + II + III + IV$

$f = cd + abd + abc + \bar{a}\bar{b}\bar{d}$

eg(ii) $f=(A,B,C,D) = \Sigma m(0,2,3,5,7,8,10,11,14,15)$

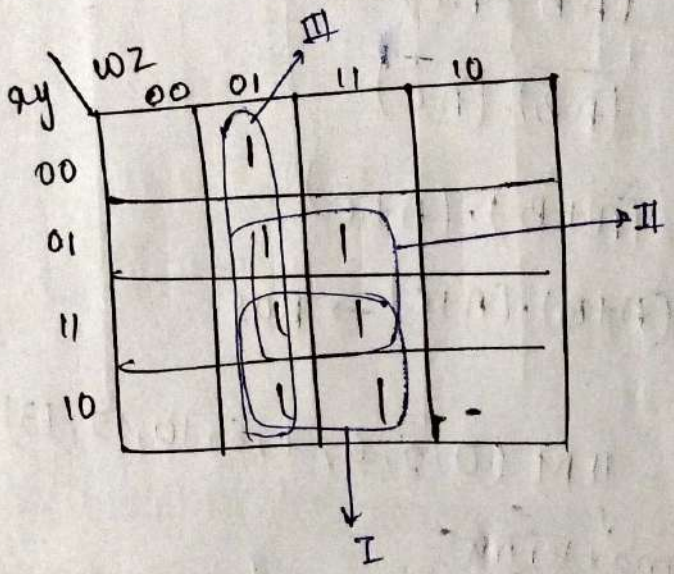
sol:



$f = I + II + III + IV$

$f = CD + AC + \bar{A}B\bar{D} + \bar{B}\bar{D}$

eg(iii) $f(w,x,y,z) = \Sigma m(1,5,7,9,11,13,15)$

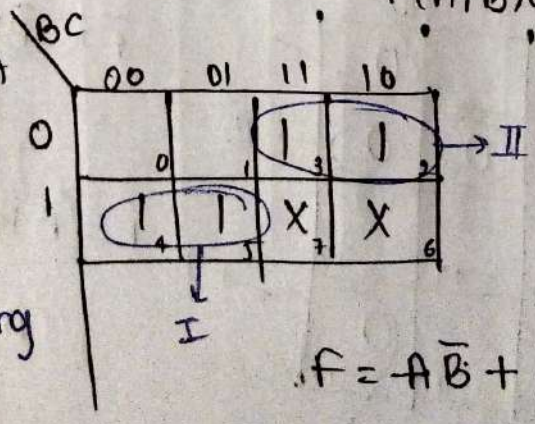


$f = \bar{w}z + yz + xz$

Don't care in K-MAP:-

$f(A,B,C) = \Sigma m(2,3,4,5) + \Sigma d(6,7)$

(i)



without ~~without~~ considering 'X'

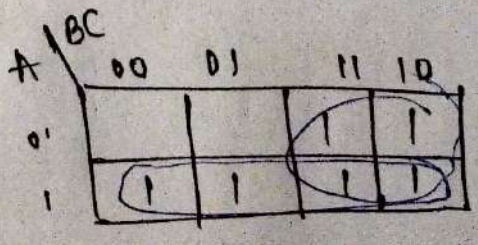
'dontcare can be '0' or '1'

max

min

$f = A\bar{B} + \bar{A}B = A \oplus B$

(ii) ✓



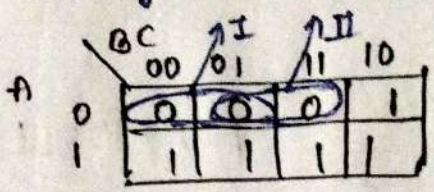
with $X = 1$

$f = A + B$

K-Map using Max terms: (grouping 0's)

* Min terms
  X = 1
* Max terms
  X = 0

eg1:



~~F = $\bar{A}\bar{B} + A\bar{B}$~~

$\bar{F} = \bar{A}\bar{B} + \bar{A}C$

↳ Apply demorgans law

$\overline{(\bar{F})} = \overline{(\bar{A}\bar{B} + \bar{A}C)}$

$= \overline{(\bar{A}\bar{B})} \cdot \overline{(\bar{A}C)}$

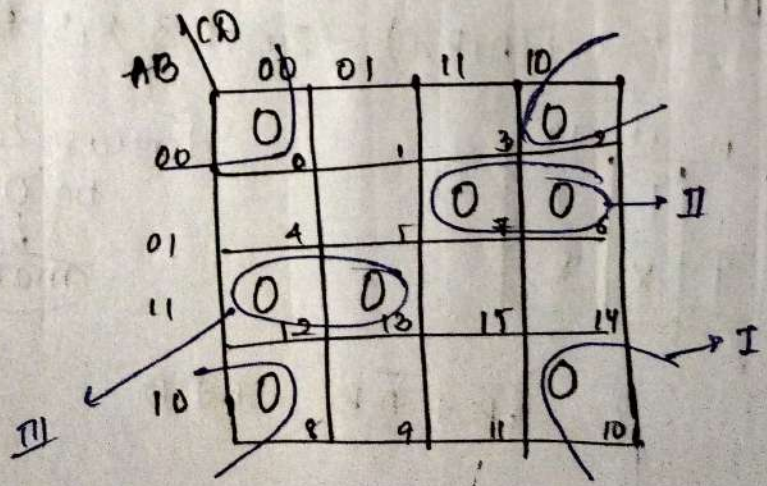
$= (\bar{\bar{A}} + \bar{\bar{B}}) \cdot (\bar{\bar{A}} + \bar{C})$

$F = (A+B) \cdot (A+\bar{C})$ → POS

eg2:

$f(A,B,C,D) = \Pi M\,(0,2,6,7,8,10,12,13)$

↓ max terms



$\bar{F} = \bar{B}\bar{D} + AB\bar{C} + \bar{A}BC$

$F = (B+D) \cdot (\bar{A}+\bar{B}+C) \cdot (A+\bar{B}+\bar{C})$

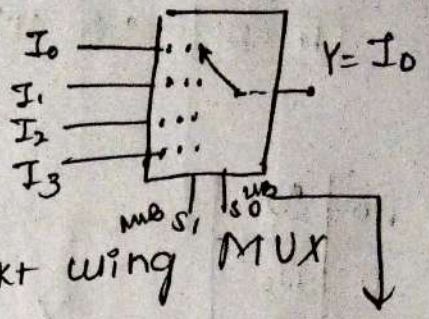
Introduction to Multiplexers:- (MUX)

→ combinational ckt that selects binary info from one of many i/p lines & directs it to o/p line

→ Simple data selector

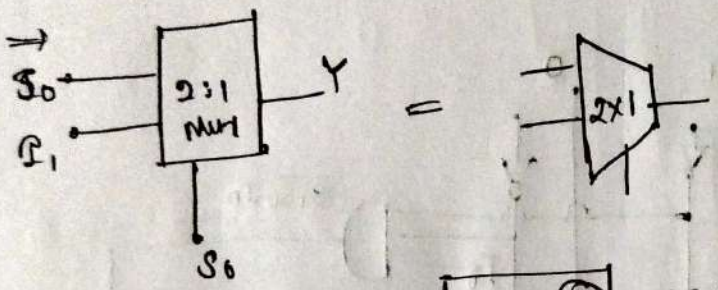


advantages / why mux:-

1. Reduce no of wires → because gates ↓
2. " ckt complexity & cost
3. Implementation of various ckt using universal logic ckt

if $S_1, S_0 = 0\ 0$ the I_0 will selected

if $S_1, S_0 = 1\ 1$ then I_3 will selected



$n = 2^m$ → no of Select lines

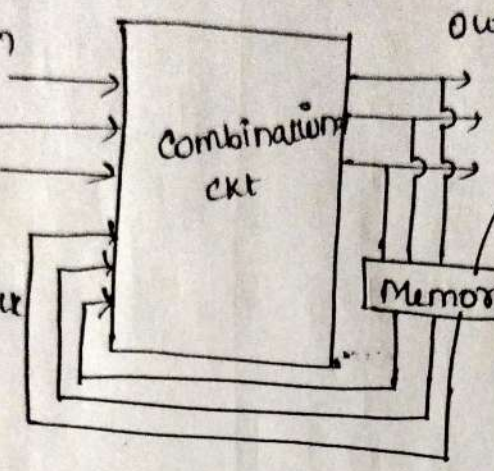
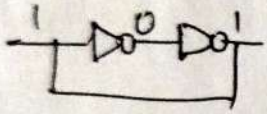
Sequential Circuits:-

→ The sequential circuits, the present o/p depends on the present i/p as well as past o/p or o/p's



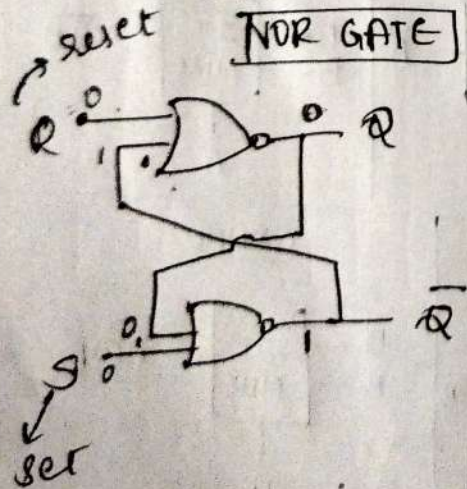
In sequential ckt everything is combckt except memory/ feedback

eg



SR-latch < NAND GATE / NOR GATE

→ The basic storage element is called LATCH, as the name suggests it latches "0" as "1"



reset → Q=0
set → Q=1

T.T for NOR gate:

A	B	Y
0	0	1
0	1	0
1	0	0
1	1	0

Case (i)

S=0, R=1

so, Q=0, $\bar{Q}$=1

S=0, R=0

but, Q=0, $\bar{Q}$=0

memory

Case (ii)

S=1, R=0

so, Q=1, $\bar{Q}$=0

S=0, R=0

but, Q=1, $\bar{Q}$=0

memory

Case (iii)

S=1, R=1, Q=0, $\bar{Q}$=0

S=0, R=0, contradiction

Not used

for S=0, R=0 2 possible o/p's: $\bar{Q}$=1, Q=0 / $\bar{Q}$=0, Q=1 | not good

for NOR gate

S	R	Q	$\bar{Q}$
0	0	memory (as before)	
0	1	0	1
1	0	1	0

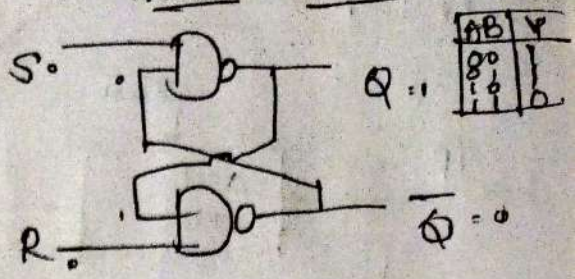
NAND GATE



S	R	Q	$\bar{Q}$
0	0	not used.	
0	1	1	0
1	0	0	1
1	1	memory (as before)	

Case (i):

S = 0, R = 1, Q = 1, $\bar{Q}$ = 0

not used. S = 0, R = 0 → not valid.

S = 1, R = 1 = Q = 1, $\bar{Q}$ = 0

memory

Case (ii)

S = 1, R = 0, Q = 0, $\bar{Q}$ = 1

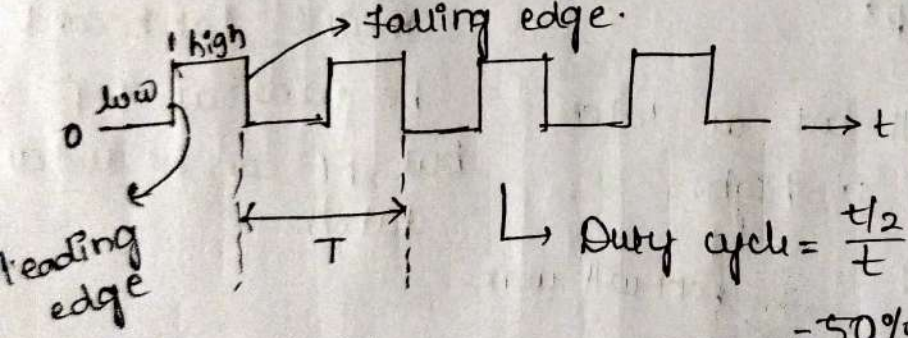
S = 1, R = 1, Q = 0, $\bar{Q}$ = 1

memory

not used S = 0, R = 0 → not valid

→ cannot i/p

What is a Clock:- signal



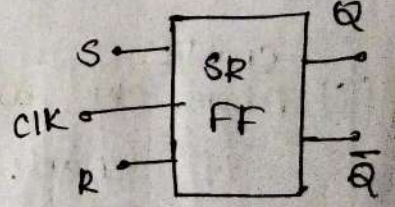
Duty cycle = $\frac{t/2}{t}$

= 50%.

$f = 1/T$

To maintain CKT high speed f ↑ so T ↓

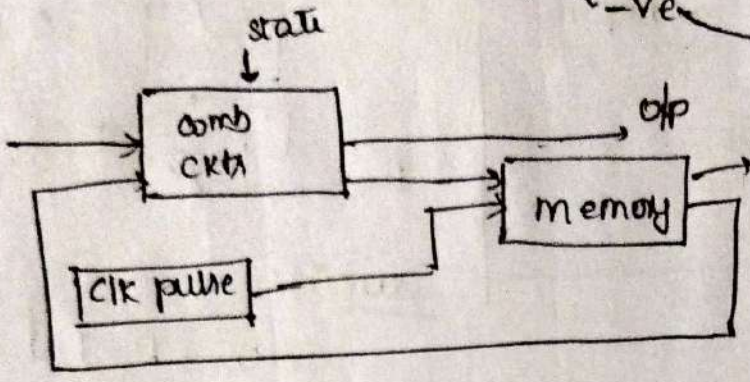
eg: CKT will work only if clk is high.

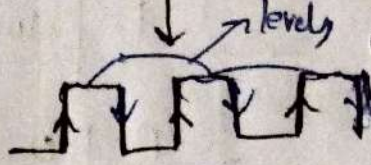


Duty cycle:- Ratio of time signal high to total time

$$D = \frac{\text{time signal high}}{\text{total time}} \times 100\%$$

Triggering Methods:- level (when ever signal high change/transition in latch/FF)
edge +ve
-ve

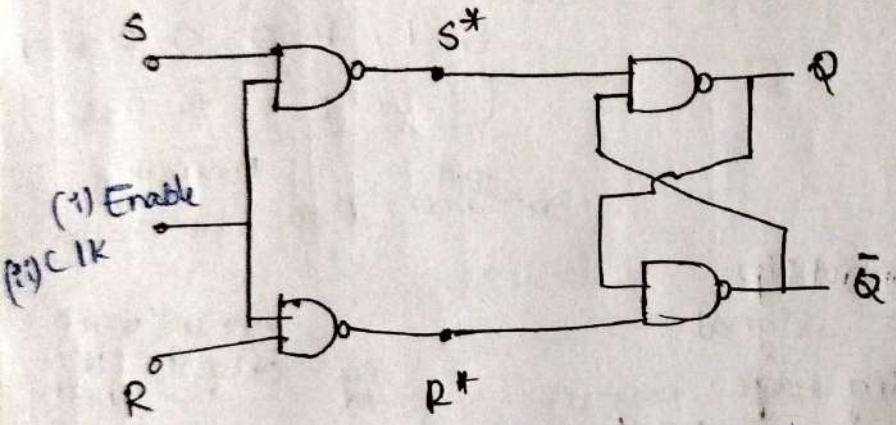




level sensitive → enable
edge sensitive → clk.

+ve → Low to high
-ve → high to low

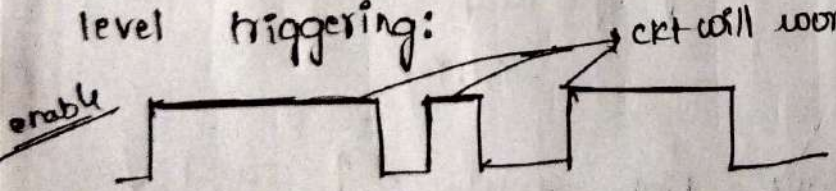
Difference btw Latch & flipflops:-



In latch we don't have control signal (clk) but in flipflop we have clk means latch can't be used as F.F but FF can be used as latch.

Enable
(i) Above ckt will act as latch if enable is high.

level triggering:



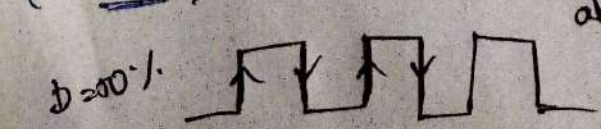
because $S^* = \bar{S} + \bar{En}$

If $En = 1$, $S^* = \bar{S}$

if $En = 0$, $S^* = 1$, $R^* = 1$ → memory

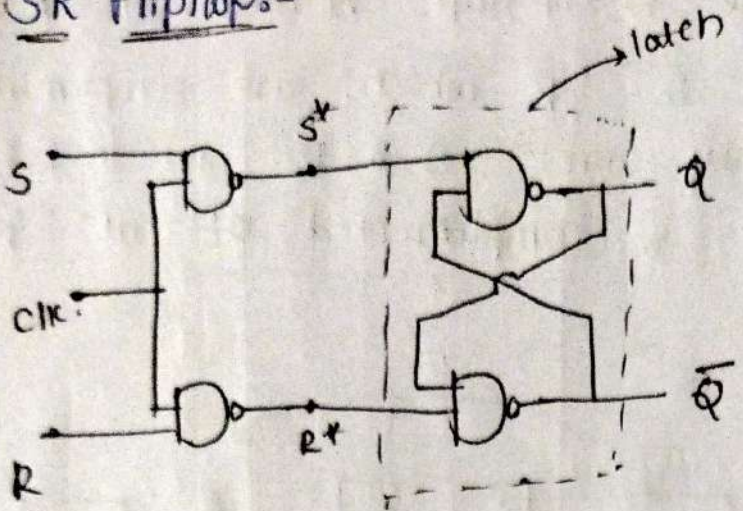
SR latch ✓

(ii) CLK :-



above ckt is FF when there is CLK & edge triggering

SR Flipflops:-



SR latch with NAND

S^*	R^*	Q $\bar{Q}$
0	0	not used
0	1	1 0
1	0	0 1
1	1	Memory

CLK is used to prevent ckt from changing accidently, it will change when ever we need to change

$$S^* = \overline{S \cdot CLK} = \bar{S} + \overline{CLK}$$
$$R^* = \overline{R \cdot CLK} = \bar{R} + \overline{CLK}$$ → (1)

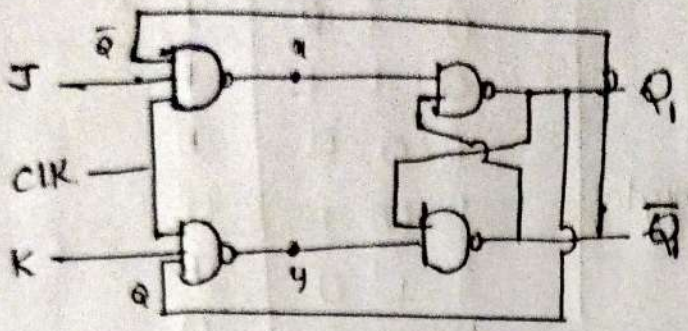
JK flipflop:-

In SR & D FF have invalid case, but we will overcome that problem.



case(i):-

CLK = 0, J = 0, K = 0

x = 1, y = 1 (HL)

$x = \overline{CLK} + \bar{J} + \overline{\bar{Q}}$

$= \overline{CLK} + \bar{J} + Q$

$= 1 + \bar{J} + Q$

$= 1$

Ny $y = 1$ (from NAND SR latch)

from, x = 1, y = 1

Q, $\bar{Q}$ auth as memory

case(ii):-

CLK = 1, J = 0, K = 1, $Q_1 = 0$ $\bar{Q}_1 = 1$

$x = \overline{CLK} + \bar{J} + \bar{Q}$ | $y = \overline{CLK} + K + \bar{Q}$

$x = 0 + 1 + Q$ | $y = 0 + 0 + \bar{Q}$

$x = 1$ | $y = \bar{Q}$ if Q = 1

$y = 0$

$\bar{Q}$ & (y) 10, from SR latch

S = 1, R = 0

$Q_1 = 0$, $\bar{Q}_1 = 1$

Ny case(iii)

CLK = 1, J = 1, K = 0, $Q_1 = 1$, $\bar{Q}_1 = 0$

as S = 0, R = 1

Q = 0, 1, 0, 1, 0 - - -

$\bar{Q}$ = 1, 0, 1, 0, 1 - - -

case(iii):-

CLK = 1, J = 1, K = 0

assume) Q = 0 & $\bar{Q} = 1$

so, $x = \overline{1 \cdot J \cdot CLK}$

$= \bar{1} + \bar{J} + \overline{CLK}$

$= \bar{1} + \bar{1} + \bar{1}$

$= 0$

$x = 0$ · = S

$y = \overline{D \cdot K \cdot CLK}$

$= 0 + 0 + 1$

$y = 1$: R

so, $Q_1 = 1$, $\bar{Q}_1 = 0$

now, 2) Q = 1, $\bar{Q}_1 = 0$

then, x = 1, y = 0

$Q_1 = 0$, $\bar{Q}_1 = 1$

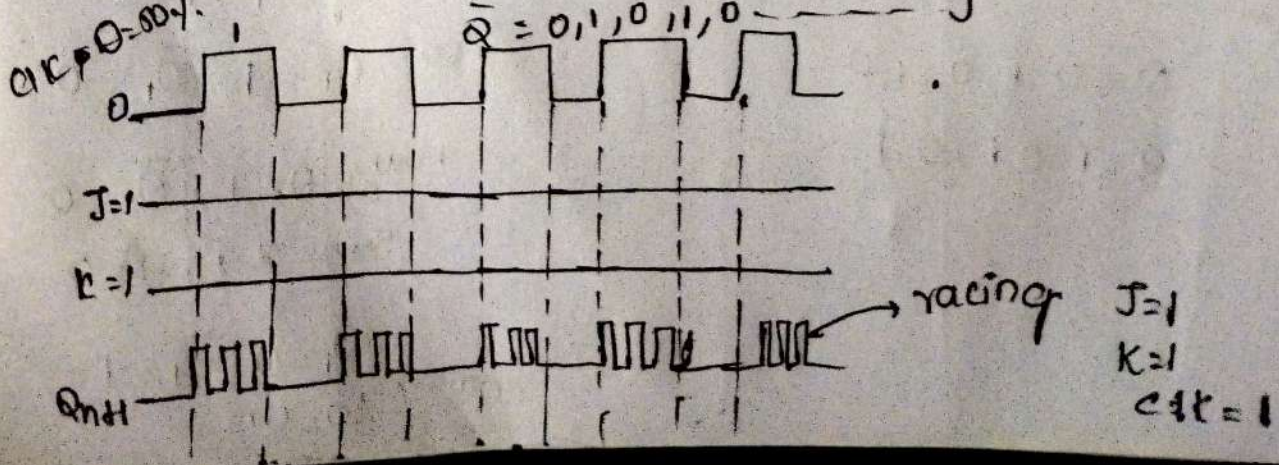
Race around cond or racing in JK flip flop:-

as we see, $Q = 1,0,1,0,1,---$ } o/p is racing.

$\bar{Q} = 0,1,0,1,0,---$



Conditions to overcome racing:-

(i) $T/2$ < propagation delay of FF → not practical, so not used

(ii) Instead of level trigg use edge trigg

(iii) Master slave.

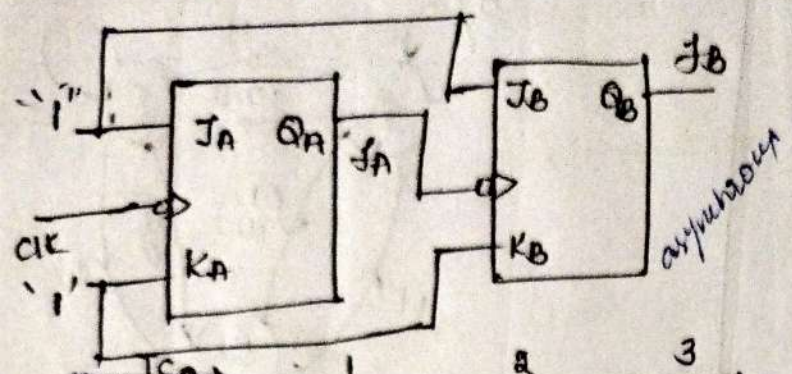
Difference btw Synchronous & Asynchronous :-

Synchronous	Asynchronous
→ These ckts are easy to design & but they are slower	→ These ckts are diff to design but they are faster as clk is not present
→ A clocked FF acts as memory element [FF]	→ An unclocked FF or time delay element is used as memory element [latch]
→ The status of memory element is affected only at the active edge of clk, if i/p is change	→ The status of memory will change any time as soon as i/p is changed

Introduction to Counters:-

FF as divide by 2 ckt:-



$T_A = 2T_C$

$\frac{1}{f_A} = \frac{2}{f_C}$

$f_A = \frac{f_C}{2}$

$f_B = \frac{f_A}{2} = \frac{f_C}{4}$ ✓

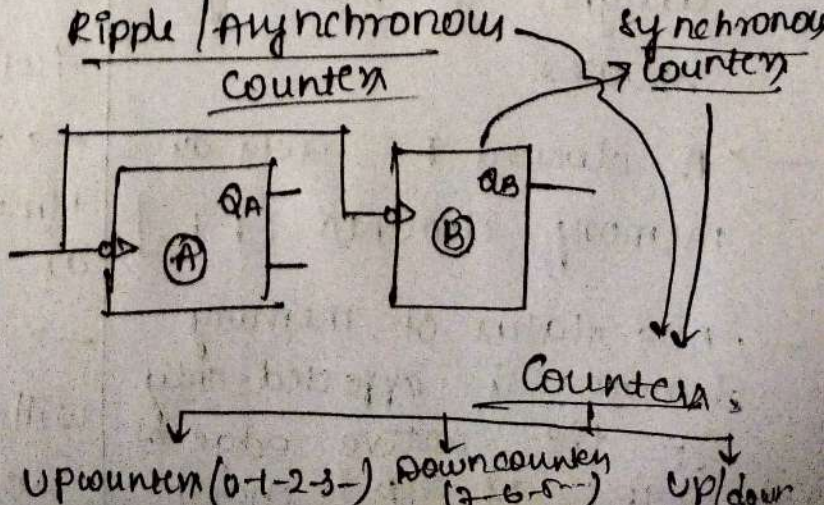
Types of counters:-



Asynchronous / ripple counter	Synchronous counter
1) FF are counted in such a way that the o/p of 1st FF drives the clk of next FF	1) There is no connection b/w o/p of 1st FF & clk of next FF
2) FF are not clked simultaneously & ckt is simple for more no. of states	2) FF are clocked simultaneously & ckt becomes complicated as no. of states ↑.
3) speed is slow as clk is propagated through no. of stages	3) speed is high as clk is given at same time

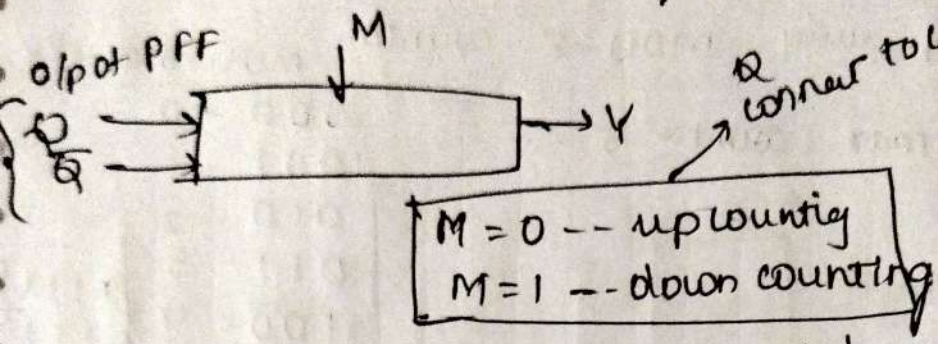
3-bit & 4-bit Up/Down ripple counter :-

→ We have designed the up counters & down counters separately but in practice both these modes are combined

→ A mode control i/p (M) is used to select either up or down mode.

→ A comb ckt is req btw each pair of FF.



M	b	$\bar{Q}$	Y
0	0	0	0
0	0	1	0
0	1	0	1

Modulus of the Counter & Counting up to particular Value:-

→ 2-bit up/down Counter is called MOD-4 or modulus 4 counter

→ 3-bit counter is called MOD-8 counter.

n → no. of bits

MOD number = 2^n

Eg: MOD-6 counter using MOD-8 counter.

State = 6 max Count - 5

MOD-6 counter

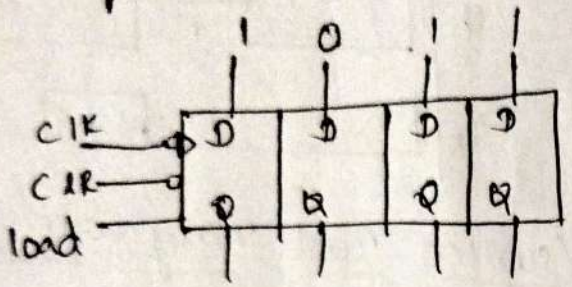
Introduction to registers:-

→ FF is '1' bit memory cell

→ To increase the storage capacity, we have to use group of FF. This group of ff is known as "REGISTER"

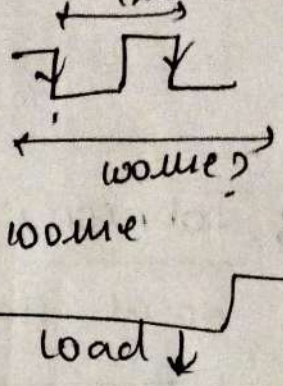
→ The n-bit register consist of "n" no. of FF & capable of storing "n-bit" word.



Synchronous: clock & load ↑

Asynchronous: only load ↑

we are bound to follow the clock

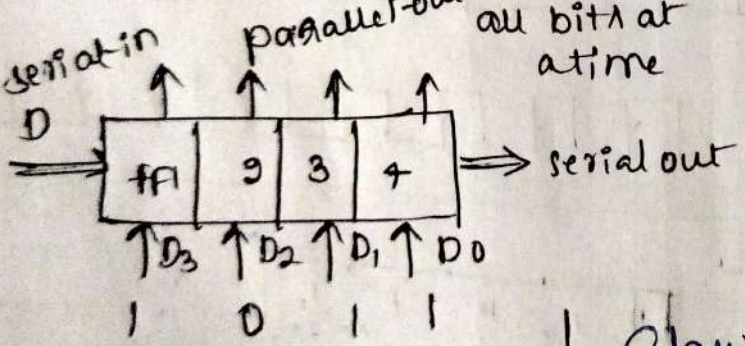


Data formats & classification of registers:-

↳ can be entered as μ or serial form

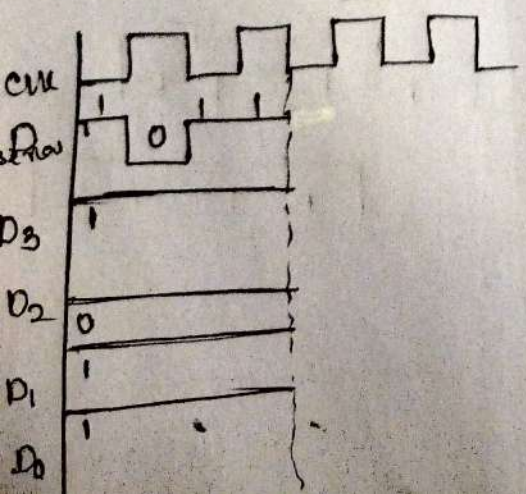
μ → all bits at a time

serial → 1-bit at a time.



Serial form - Temporal code

μ form - Special code



Classification:

(i) Depending on i/p & o/p

a) SISO b) SIPO c) PISO d) PIPO

(ii) Depending on applications

*a) Shift reg ← Bidirectional universal

PLA:- Programmable Logic Array (PLD) device

It is a type of fixed architecture logic device with programmable AND gates followed by programable OR gates.

Eg

Step:1

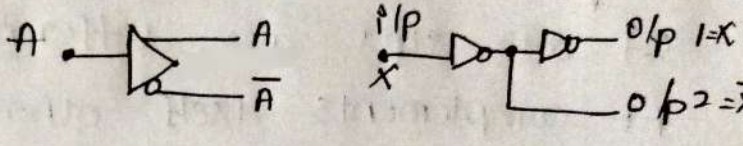
A	B	C	Y_1	Y_2
0	0	0	0	0
0	0	1	0	0
0	1	0	0	0
0	1	1	0	1
1	0	0	1	0
1	0	1	1	1
1	1	0	0	0
1	1	1	1	1

$Y = A\bar{B}\bar{C} + A\bar{B}C + ABC$

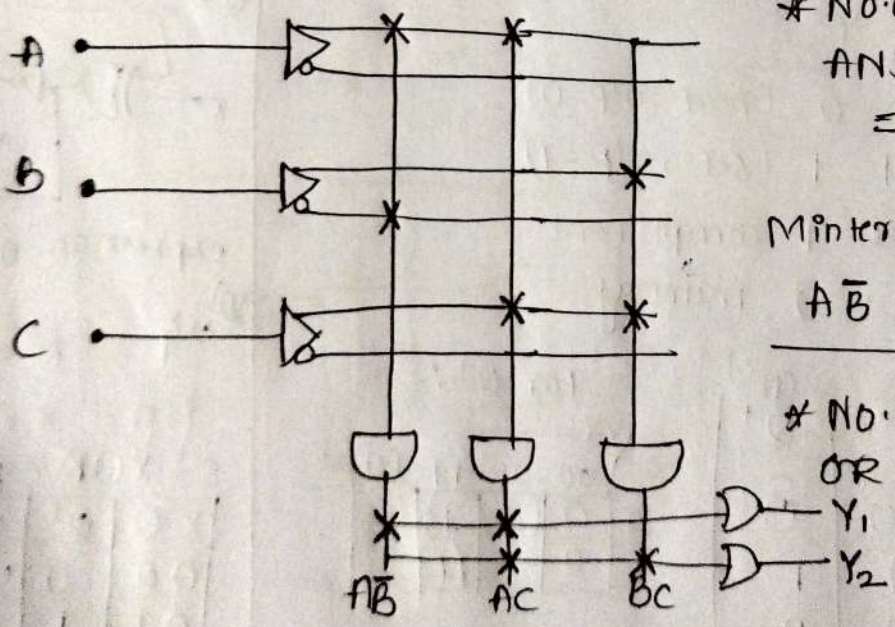
$Y_1 = A\bar{B} + AC$ } Minimal sop form

$Y_2 = BC + AC$ } Step:2

Step 3: No. of i/p Buffers = No. of variables



∴ No. of i/p Buffers = 3



* No. of programmable AND Gates = No. of minterms (not repeated)

Minterms are (3)

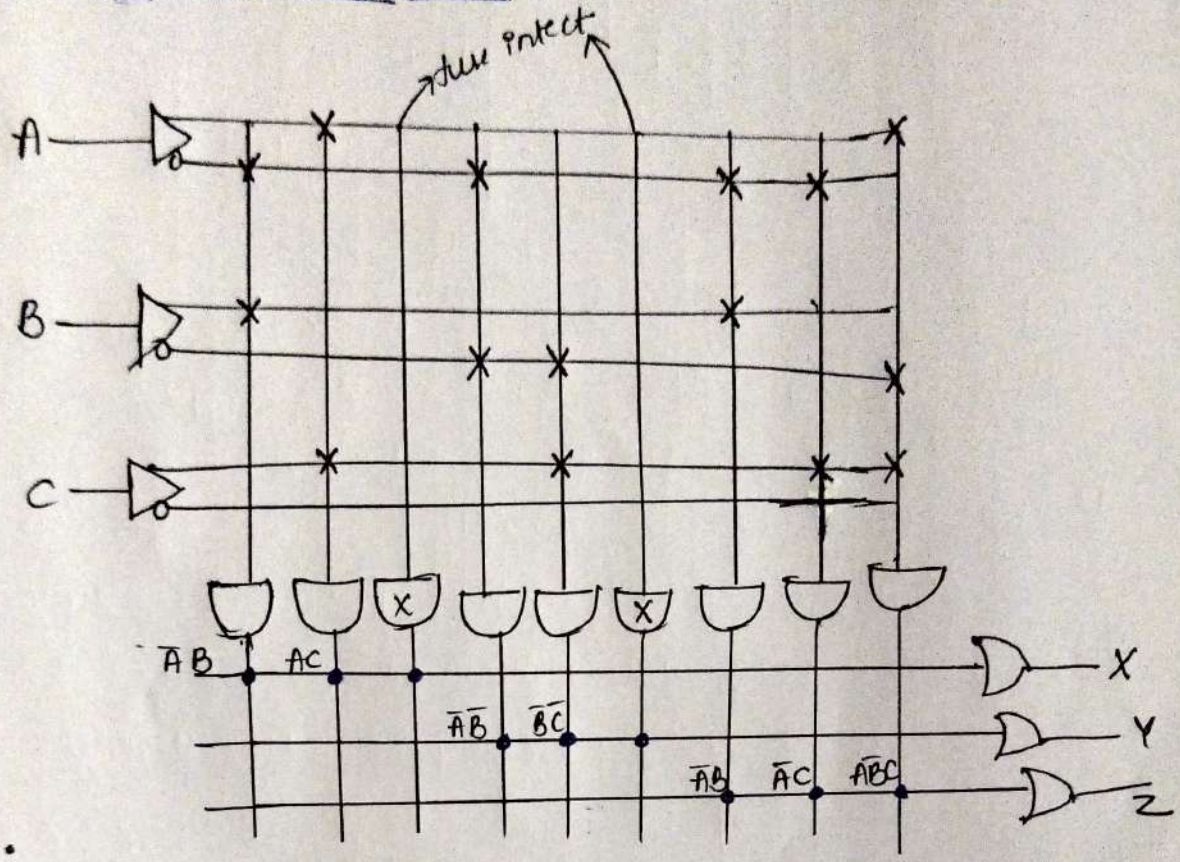
$A\bar{B}$, AC, BC

* No. of programmable OR gate

Programmable Array Logic (PAL):-

→ It is mostly commonly used type of PLD.

→ Has programmable AND array & fixed OR array.



Step 1:

$X(ABC) = \Sigma m(2,3,5,7) = \bar{A}B + AC$

$Y(ABC) = \Sigma m(0,1,5) = \bar{A}\bar{B} + \bar{B}C$

$Z(ABC) = \Sigma m(0,2,3,5) = \bar{A}B + \bar{A}C + A\bar{B}C$

Step 2:- By solving K-maps

No. of variables = 3 = no. of ip buffers (A, B, C)

No. of AND gates unique minterms = {$\bar{A}B$, AC}, {$\bar{A}\bar{B}$, $\bar{B}C$}, {$\bar{A}B$, $\bar{A}C$, $A\bar{B}C$}

= 3

No. of OR gates = O/p = X, Y, Z.

So we have to take 3 AND for each case

total = 9 AND gate
